

CS2505: Network Management

Copyright Notice: The CS2505 lecture notes are adapted from material provided by J.F. Kurose and K.W. Ross and includes material by C.J. Sreenan, L.L. Peterson, B.S. Davie and others. This material is copyrighted and so these lecture notes must not be copied or distributed without permission.

CS2505: Network Management 1

Outline

- ❑ Introduction to network management
 - motivation
 - major components
- ❑ Internet network management framework
 - MIB: management information base
 - SMI: data definition language
 - SNMP: protocol for network management
 - security and administration
- ❑ The presentation problem: ASN.1

CS2505: Network Management 4-2

What is network management?

- **autonomous systems (aka "network")**: 100s or 1000s of interacting hardware/software components
- other complex systems requiring monitoring, control:
 - jet airplane
 - nuclear power plant
 - others?

"Network management includes the deployment, integration and coordination of the hardware, software, and human elements to monitor, test, poll, configure, analyze, evaluate, and control the network and element resources to meet the real-time, operational performance, and Quality of Service requirements at a reasonable cost."

CS2505: Network Management 4-3

Infrastructure for network management

definitions:

CS2505: Network Management 4-4

Network Management standards

OSI CMIP

- ❑ Common Management Information Protocol
- ❑ designed 1980's: *the* unifying net management standard
- ❑ too slowly standardized

SNMP: Simple Network Management Protocol

- ❑ Internet roots (SGMP)
- ❑ started simple
- ❑ deployed, adopted rapidly
- ❑ growth: size, complexity
- ❑ currently: SNMP V3
- ❑ *de facto* network management standard

CS2505: Network Management 4-5

Outline

- ❑ Introduction to network management
- ❑ Internet-standard management framework
 - Structure of Management Information: SMI
 - Management Information Base: MIB
 - SNMP Protocol Operations and Transport Mappings
 - Security and Administration
- ❑ The presentation problem: ASN.1

CS2505: Network Management 4-6

SNMP overview: 4 key parts

- ❑ **Management information base (MIB):**
 - distributed information store of network management data
- ❑ **Structure of Management Information (SMI):**
 - data definition language for MIB objects
- ❑ **SNMP protocol**
 - convey manager<->managed object info, commands
- ❑ **security, administration capabilities**
 - major addition in SNMPv3

CS2505: Network Management 4-7

SMI: data definition language

Purpose: syntax, semantics of management data well-defined, unambiguous

- ❑ base data types:
 - straightforward, boring
- ❑ OBJECT-TYPE
 - data type, status, semantics of managed object
- ❑ MODULE-IDENTITY
 - groups related objects into MIB module

Basic Data Types

INTEGER
Integer32
Unsigned32
OCTET STRING
OBJECT IDENTIFIED
IPAddress
Counter32
Counter64
Gauge32
Time Ticks
Opaque

CS2505: Network Management 4-8

SNMP MIB

MIB module specified via SMI
MODULE-IDENTITY
 (100 standardized MIBs, more vendor-specific)

CS2505: Network Management 4-9

SMI: Object, module examples

OBJECT-TYPE: ipInDelivers

```
ipInDelivers OBJECT TYPE
SYNTAX Counter32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
    "The total number of input
    datagrams successfully
    delivered to IP user-
    protocols (including ICMP)"
::= { ip 9}
```

MODULE-IDENTITY: ipMIB

```
ipMIB MODULE-IDENTITY
LAST-UPDATED "941101000Z"
ORGANIZATION "IETF SNMPv2
    Working Group"
CONTACT-INFO
    " Keith McCloghrie
    ....."
DESCRIPTION
    "The MIB module for managing IP
    and ICMP implementations, but
    excluding their management of
    IP routes."
REVISION "019331000Z"
.....
::= {mib-2 48}
```

CS2505: Network Management 4-10

MIB example: UDP module

Object ID	Name	Type	Comments
1.3.6.1.2.1.7.1	UDPInDatagrams	Counter32	total # datagrams delivered at this node
1.3.6.1.2.1.7.2	UDPNoPorts	Counter32	# undeliverable datagrams no app at port
1.3.6.1.2.1.7.3	UDInErrors	Counter32	# undeliverable datagrams all other reasons
1.3.6.1.2.1.7.4	UDPOutDatagrams	Counter32	# datagrams sent
1.3.6.1.2.1.7.5	udpTable	SEQUENCE	one entry for each port in use by app, gives port # and IP address

CS2505: Network Management 4-11

SNMP Naming

question: how to name every possible standard object (protocol, data, more..) in every possible network standard??

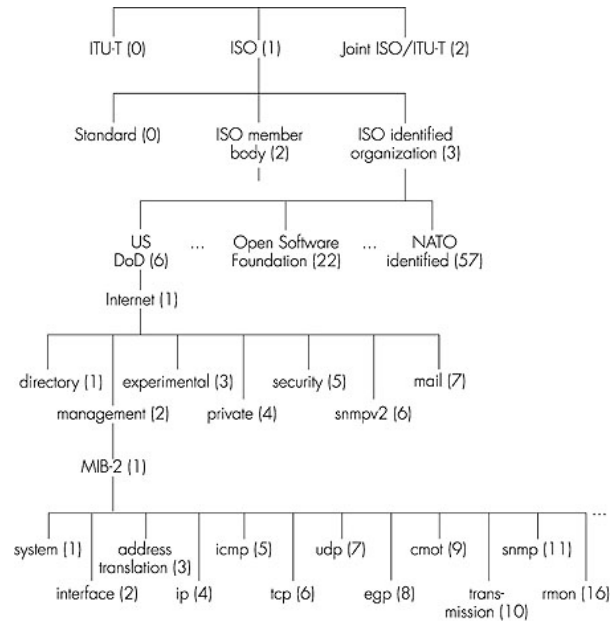

answer: ISO Object Identifier tree:

- o hierarchical naming of all objects
- o each branchpoint has name, number

CS2505: Network Management 4-12

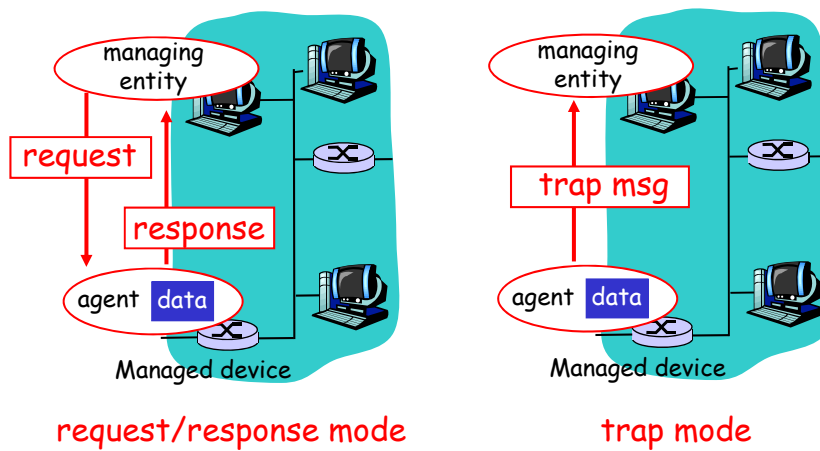

OSI Object Identifier Tree

CS2505: Network Management 4-13

SNMP protocol

Two ways to convey MIB info, commands:

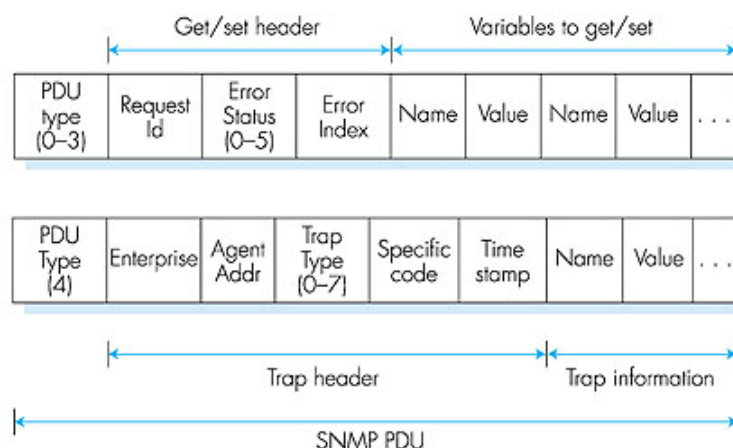

CS2505: Network Management 4-14

SNMP protocol: message types

<u>Message type</u>	<u>Function</u>
GetRequest GetNextRequest GetBulkRequest	Mgr-to-agent: "get me data" (instance,next in list, block)
InformRequest	Mgr-to-Mgr: here's MIB value
SetRequest	Mgr-to-agent: set MIB value
Response	Agent-to-mgr: value, response to Request
Trap	Agent-to-mgr: inform manager of exceptional event

CS2505: Network Management 4-15

SNMP protocol: message formats

CS2505: Network Management 4-16

SNMP security and administration

- ❑ **encryption:** DES-encrypt SNMP message
- ❑ **authentication:** compute, send $MIC(m,k)$:
compute hash (MIC) over message (m),
secret shared key (k)
- ❑ **protection against playback:** use nonce
- ❑ **view-based access control**
 - SNMP entity maintains database of access rights, policies for various users
 - database itself accessible as managed object!

CS2505: Network Management 4-17

Outline

- ❑ Introduction to network management
- ❑ Internet-standard management framework
 - Structure of Management Information: SMI
 - Management Information Base: MIB
 - SNMP Protocol Operations and Transport Mappings
 - Security and Administration
- ❑ The presentation problem: ASN.1

CS2505: Network Management 4-18

The presentation problem

- SNMP agents and manager may have different ways of representing data, leading to misinterpretation of message contents

```
struct {  
  char code;  
  int x;  
} test;  
test.x = 256;  
test.code='a'
```

test.code	a
test.x	00000001
	00000011

host 1 format

test.code	a
test.x	00000011
	00000001

host 2 format

CS2505: Network Management 4-19

Presentation problem: potential solutions

1. Sender learns receiver's format. Sender translates into receiver's format. Sender sends.
 - real-world analogy?
 - pros and cons?
2. Sender sends. Receiver learns sender's format. Receiver translate into receiver-local format
 - real-world-analogy
 - pros and cons?
3. Sender translates host-independent format. Sends. Receiver translates to receiver-local format.
 - real-world analogy?
 - pros and cons?

CS2505: Network Management 4-20

ASN.1: Abstract Syntax Notation 1

- ❑ **ISO standard X.680**
 - used extensively in Internet
- ❑ **defined data types**, object constructors
 - like SMI
- ❑ **BER: Basic Encoding Rules**
 - specify how ASN.1-defined data objects to be transmitted
 - each transmitted object has Type, Length, Value (TLV) encoding

CS2505: Network Management 4-21

TLV Encoding

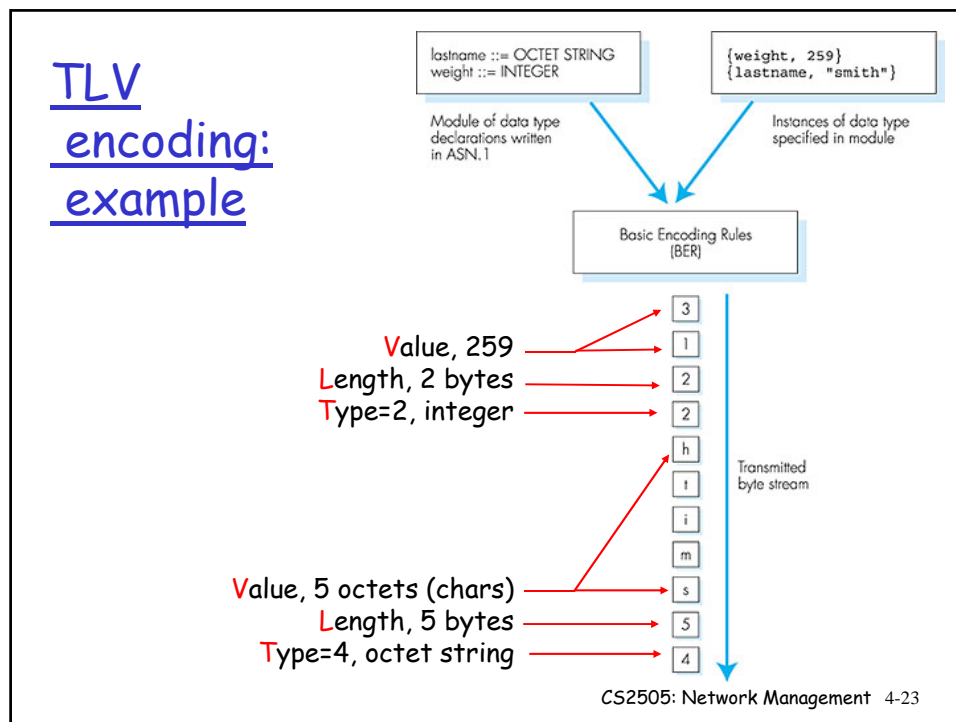

Idea: transmitted data is self-identifying

- **T**: data type, one of ASN.1-defined types
- **L**: length of data in bytes
- **V**: value of data, encoded according to ASN.1 standard

<u>Tag Value</u>	<u>Type</u>
1	Boolean
2	Integer
3	Bitstring
4	Octet string
5	Null
6	Object Identifier
9	Real

CS2505: Network Management 4-22

TLV encoding: example

Network Management: summary

- ❑ network management
 - extremely important: 80% of network "cost"
 - ASN.1 for data description
 - SNMP protocol as a tool for conveying information
- ❑ Network management: more art than science
 - what to measure/monitor
 - how to respond to failures?
 - alarm correlation/filtering?
